

Platform enhancement plan

Prepared July 2026 · Covers dashboard, campaigns, creators, settings, and the AI-assisted creation flow

Where the product stands

MoonTech is now a beautiful *launcher* — sign-up, eligibility, dashboard, an AI-first creation flow, creator approvals, and settings are all polished. But the life of a campaign *after* payment is invisible: the core promise, “guaranteed ROAS, phase by phase,” has no surface where a brand can watch it happen. This plan closes that loop first, then deepens control and trust, then extends the AI assistant across the product.

Design principles for this round

1 · No dead ends
Every “View →”, bell, and Help must land somewhere real.

2 · Close the money loop
Pay → watch → unlock → pay again, all visible.

3 · Decisions over data
Every screen answers “what needs me right now?”

4 · AI removes work, not control
The assistant proposes; the brand approves.

The audit — where the product breaks today

#	GAP	WHY IT HURTS	SEVERITY
1	No campaign detail page — every “View →” dead-ends	The core object of the product can’t be opened	Critical
2	Notification bell shows “2” but opens nothing	Phase unlocks — the aha moment — go unannounced	High
3	No content / ad review surface	Brands can’t see or control what creators post	High
4	Creators queue lacks speed tools (sort, keyboard, undo)	Reviewing 8+ profiles is all mouse-work	Medium
5	No billing history after paying Phase 1	Payments vanish — a trust issue for a money product	Medium
6	Dashboard date filter is cosmetic; no drill-downs	The analytics feel real until touched	Medium
7	Empty / done states missing (creators, Help, FAQ)	Loose ends read as unfinished	Low
8	AI stops at creation	Post-launch questions have no home	Later

Prioritization — impact vs. effort

Nine proposed enhancements plotted by impact vs. effort; color marks the delivery phase.

The roadmap

Phase 1 — close the loop · weeks 1–2

Campaign detail page (wire every dead “View →”), a working notification center whose hero moment is “Phase 2 unlocked — pay to continue,” and done/empty states. **Outcome:** a brand can follow their money end-to-end.

Phase 2 — control and trust · weeks 3–4

The ad review queue (approve/reject creator content before it counts), creator-review speed tools (sort, keyboard, undo), and a billing page with per-phase invoices. **Outcome:** brands feel in command of what runs under their name.

Phase 3 — copilot everywhere · weeks 5+

Extend the chat agent beyond creation: “why did ROAS dip this week?”, “reallocate budget to top creators,” weekly auto-reports. **Outcome:** MoonTech stops being a dashboard you check and becomes an operator you talk to.

Sketch 1 — the campaign detail page (the missing core screen)

One screen that answers: how is it doing, what unlocked, who is driving it, what did it post, what do I owe.

1. **Phase stepper in the header** — the campaign's spine (✓ done, ring = live), always visible.
2. **Unlock meter** — the 80% threshold as a physical tick on the revenue bar.
3. **Tabs** scale the page without clutter — Creators and Content reuse existing components.
4. **The pay moment lives here** — when a phase unlocks, the primary CTA appears next to the evidence.
5. **Activity feed** — ties everything to a timeline and links into the review queue (sketch 2).

Sketch 2 — the content review queue (Phase 2's big bet)

1. **Keyboard rhythm** — A/R keys + progress; a brand clears 12 ads in under a minute.
2. **Tracker check** — the coupon code is verified live before approval, protecting attribution.
3. **Reject reasons** — one tap, returned to the creator, and training signal for matching.
4. **Undo toast** — decisions are cheap to reverse, so review stays fast.

Supporting pieces

- **Notification center** — three high-signal types: phase unlocked (pay CTA), content awaiting review, weekly summary.
- **Billing and invoices** — Payments tab on campaign detail + list in Settings (phase, amount, VAT, invoice).
- **Creators cockpit** — sort/filter + keyboard + undo drop into the existing page.
- **Done states** — “All caught up” with a session summary; Help/FAQ get a destination.

How we'd know it worked

- Time from signup → first campaign paid (target: under 10 minutes)
- Phase 1 → Phase 2 payment conversion — the unlock moment is the revenue engine
- Review throughput: creators + ads reviewed per session
- “View →” click-through on the dashboard becomes the #1 path
- Weekly returning brands — detail page + notifications give a reason to come back

Recommendation: start with the campaign detail page — highest-impact single build, consumes components that already exist, and every dead-end CTA instantly gets a home.
